GENERAL INFORMATION

Neurosurgery focuses on the central, peripheral and autonomic nervous systems. Practitioners diagnose problems through physical examination with the aid of such tools as MRI, CT scans and laboratory tests and frequently provide surgical treatment. Neurosurgery includes management of diseases of the skull, the brain, the pituitary and the spinal cord. Management of head and spinal injuries is a major challenge. As many head injuries and acute intracranial emergencies occur in off-hours, this is not a specialty for those who value lifestyle. It is, however, a very challenging and rewarding career.

Neurosurgery as a discipline arose as a result of an increasing need for special expertise in the surgical and non-surgical treatment of various diseases affecting the nervous system and supporting structures. Therefore, it involves the ability to diagnose, and the technical expertise for the effective surgical treatment of congenital and acquired abnormalities. It also requires expertise in trauma and diseases affecting the nervous system that can be potentially prevented, alleviated or cured.

GENERAL INFORMATION

This specialty requires the physician to be well-grounded in the principles of both neurosurgery and surgery in general. Thus, the fully-trained resident must demonstrate proficiency and expertise in the:

- care of neurosurgical emergencies;
- principles of pre- and post-operative general surgical care;
- treatment of deep vein thrombosis;
- management of fluid and electrolyte disturbances;
- treatment of sepsis, the use of antibiotic therapy and an understanding of the implications of antibiotic prophylaxis;
- understanding of vascular shock and its treatment;
- an understanding of the diagnostic importance of disordered blood gas analyses and their treatment;
- acute, subacute and chronic management of parenteral nutritional support.

GENERAL INFORMATION

A neurosurgical resident must have knowledge, clinical ability and surgical skill as these apply to surgical diseases of the nervous system. They must have familiarity with, and knowledge of, the related disciplines of basic neuroscience, neurology, neuropathology, neuroimaging and neuropsychology.

Neurosurgical residents must also demonstrate a detailed knowledge of the normal structure and function of the nervous system and of the pathological processes that unbalance it. They must develop learning strategies to enhance their knowledge and expertise so as to maintain excellent and current standards of care. Interprofessional skills are imperative as they must become effective neurosurgical consultants with respect to patient care, education of colleagues and the provision of medical legal opinions. Finally, and most importantly, the neurosurgical resident is expected to demonstrate unequivocal high moral and ethical behaviour.

GENERAL INFORMATION

Upon completion of medical school, it takes an additional six years of Royal College-approved training to become certified in neurosurgery. This period must include:

- 2 years of core training in surgery and 3 years of Royal College-approved resident training in neurosurgery. Up to six months of this period may be spent in pediatric neurosurgery;
- 1 year of training that must include 3 months of residency in neurology, 3 months of residency in neuropathology, and 3 months of residency in neuroimaging.

For further details on training requirements please go to:
