General information

Public health and Preventive medicine (PhPm) is the branch of medicine concerned with the health of populations. These specialists use population health knowledge and skills to play leading and collaborative roles in the maintenance and improvement of the health and well-being of the community. They measure the health needs of populations and develop strategies for improving health and well-being, through health promotion, disease prevention and health protection.

A public health and preventive medicine specialist demonstrates skills in leadership; development of public policy; design, implementation and evaluation of health programs and applies them to a broad range of community health issues. It is a broad specialty that includes the fields of general preventive medicine, public health and occupational medicine. It requires knowledge and expertise in: management skills; epidemiology; health education/promotion/policy; nutrition; biostatistics and health services administration.

Source: Pathway evaluation program
These specialists work in a number of settings, such as public health departments, hospitals, universities, family practice settings, public agencies, industry and non-governmental organizations. Most public health and preventive medicine specialists have little contact with individual patients. Instead, their ‘patient’ is the community and their focus is on measuring health needs, addressing primary causes of disease (including behaviour and lifestyle factors) rather than on treating symptoms and developing methods for improving the community’s health level. These practitioners are heavily involved in influencing public policy and public health issues.

After completing medical school to become a public health and preventive medicine specialist it requires 5 years of approved residency training. This includes:

- 1-2 years of basic clinical training;
- 3 years in a Royal College-approved, university-sponsored program that includes course work in the sciences of community medicine and experience and responsibility in community medicine;

Source: Pathway evaluation program
1 further year of training, in a Royal College-approved, university-sponsored program which may include residency in a clinical specialty relevant to the practice of public health and preventive medicine (normally internal medicine, pediatrics, obstetrics or psychiatry); or with selective clinical experiences related to disease prevention and health promotion for specific populations or groups.

Many complete 2 years of clinical training through the Family Medicine Residency Program, leading to eligibility for certification in family medicine (CCFP). Also required are a minimum of 1 academic year of courses in community medicine and a minimum of 1 year of community medicine field placement.
